

# **PHYSICAL REVIEW D**

## **EDITORIAL POLICIES AND PRACTICES**

(Revised January 2002)

*Physical Review D* is published by the American Physical Society, whose Council has the final responsibility for the journal. The APS Publications Oversight Committee and the Editor-in-Chief possess delegated responsibility for overall policy matters concerning all APS journals. The Editors of *Physical Review D* are responsible for the scientific content and other editorial matters relating to the journal.

Editorial policy is guided by the following statement adopted in April, 1995 by the Council of the APS:

It is the policy of the American Physical Society that the *Physical Review* accept for publication those manuscripts that significantly advance physics and have been found to be scientifically sound, important to the field, and in satisfactory form. The Society will implement this policy as fairly and efficiently as possible and without regard to national boundaries.

*Physical Review D* has an Editorial Board whose members are appointed for three-year terms upon recommendation of the Editors after consultation with the APS Divisions of Particles and Fields and of Astrophysics. Board members play an important role in the editorial management of the journal. They assist in selecting referees, in identifying new referees, in advising on specific papers where special assistance is called for, and by participating in the formal appeal process.

### **SUBJECT AREAS**

The first-of-the-month issue (D1) is subtitled ‘‘Particles and Fields.’’ The fifteenth-of-the-month issue (D15) is subtitled ‘‘Particles, Fields, Gravitation, and Cosmology.’’

*Physical Review D1* generally covers experimental particle physics and phenomenologically oriented theory of particles and fields. *Physical Review D15* covers more formally oriented theory of particles and fields, gravitation, cosmology, and allied areas. (More detailed information follows.) Authors are welcome to indicate an issue preference for papers on borderline subject matter.

The first-of-the-month issue includes papers on subjects such as the following: experimental particle physics (and experiments in other areas of physics whose results are relevant to particles and fields); cosmic-ray physics; phenomenology of collisions; decays, masses, and other properties of particles; electroweak interactions; applications of quantum chromodynamics; development and application of more phenomenological approaches to strong interactions; development and

application of specific realistic or semirealistic models beyond the standard model; other theoretical developments of phenomenological interest; lattice gauge theory.

The fifteenth-of-the-month issue includes papers on subjects such as the following: general relativity; supergravity; quantum theory of gravitation; cosmology; astrophysics relating to cosmology and particle physics; formal aspects of theory of particles and fields; general and formal developments in gauge field theories, including quantum chromodynamics, grand unified theories; string theory; quantum electrodynamics.

If a manuscript submitted to *Physical Review D* is on a topic not within its purview, but may be suitable for another *Physical Review* journal, the Editors will transfer the paper to the appropriate journal and inform the author(s) of that transfer.

### **EDITORIAL GUIDELINES**

Papers must contain new results in physics. Confirmation of previously published results of unusual importance can be considered as new, as can significant null results. Papers advancing new theoretical views on fundamental principles or theories must contain convincing arguments that the new predictions and interpretations are distinguishable from existing knowledge, at least in principle, and do not contradict established experimental results. Mathematical and computational papers that do not have application to physics are generally not suitable for *Physical Review D*. In general, authors should keep review material to a minimum. Some review and reprise of past work is acceptable if the paper can be made more understandable and self-contained thereby.

Material previously published in a Letters journal, as a Rapid Communication, or in a conference proceedings can be the basis of a regular article in *Physical Review D*, provided the article presents considerably more information, enabling the reader to get a substantially improved understanding of the subject. Figures, tables, or text material that have been previously published should be referenced, not repeated. Exceptions can be made when warranted by unusual circumstances.

Publication of ongoing work in a series of papers should be avoided. Instead, a single comprehensive article should be published. This policy against serial publication applies to Rapid Communications and Brief Reports as well as to regular articles.

Although there is no limit to the length of regular articles, the appropriate length depends on the information presented in the paper. Authors may refer in their paper to their own internal reports or theses that contain more detail than the published article or they may deposit some of the material, especially long tables, in the Electronic Physics Auxiliary Publication Service (EPAPS) of the American Institute of Physics. Files deposited in EPAPS are made freely available via ftp and the World Wide Web. As an electronic service, EPAPS can accommodate color-figure, multimedia, and program files. Information about EPAPS is available via the Authors subpage of [prd.aps.org](http://prd.aps.org), in the Manuscript Preparation section.

The proliferation of specialized jargon can serve to inhibit communication. Excessive use of acronyms should be avoided. New terminology should be introduced only when clearly needed. New terminology should be appropriate and, if possible, convey to the reader an accurate impression of its meaning. It should not be frivolous, hard to pronounce, or based on a private joke. New terminology should not be introduced in titles.

Authors should place their work in context with the current state of research, but they are not held responsible for references to publications which had not yet appeared when their paper was submitted. They are not responsible for references to preprints, internal reports, or results which have been reported only orally at meetings (even though an abstract may have been printed). If such work is called to the attention of the authors by a referee, they are encouraged but not required to refer to it. If revision of a manuscript takes a substantial time (several months), the references should be updated to include recently published relevant work. Authors are expected to include references to books and to published conference proceedings if they contain more than abstracts.

Papers that describe proposed experiments fall into a special category. For such papers to be acceptable, the experiments must be demonstrated to be novel and feasible. It is the authors' responsibility to show that their proposal is likely to stimulate research that might not otherwise be undertaken. Generally not suitable for *Physical Review* are papers proposing a new experiment using straightforward calculations based on well-known theories or models, and papers describing simulations of apparatus or optimization or feasibility studies.

When a manuscript has several authors, one of them, the corresponding author, should be designated to receive and respond to correspondence from the editors. This designation can be changed upon notification of the editors. It is the responsibility of the corresponding author to represent all those involved with the work reported and to ensure that the content of the manuscript and the list of authors meet with

their approval, both initially and through any subsequent changes.

Authors may not present data and other results obtained by others as if they were their own. Nor may authors incorporate without attribution text from the works of another author, even when summarizing past results or background material. If a direct quotation is appropriate, the quotation should be clearly indicated as such and the original source should be properly cited. Papers that have been found to be in violation of this rule will be rejected. In such cases, resubmission of the manuscript, even with the plagiarized text removed, is not ordinarily allowed. However, the Editors may allow exceptions to this policy if warranted by special circumstances.

## EDITORIAL PROCEDURES

For nearly all manuscripts, the Editors select one or two referees to review the paper, sometimes with advice from the Editorial Board. When referee reports seem inconclusive, the Editors may consult another referee(s). Additional referees are usually sent previous correspondence, but not the identities of previous referees. Referee reports are advisory to the Editors, but are generally transmitted by the Editors to the authors, and so should be written in a collegial manner. The Editors may withhold or edit these reports for cause. If in the judgment of the Editors a paper is clearly unsuitable for *Physical Review D*, it will be rejected without review; authors of such papers have the same right to appeal as do other authors. Special review procedures for Comments are described in the section concerning Short Papers.

If a manuscript is resubmitted, it is required that authors respond fully to the referee reports that have been sent to them by the Editors. Any resubmittal should be accompanied by a summary of the changes made, and a brief response to all recommendations and criticisms. This material will normally be forwarded to reviewers, and so should be written in a collegial manner. Remarks that authors wish to address solely to the Editors should be clearly identified and separated from the summary and response.

As a matter of policy, it is the goal of the Editors to arrive at a decision on publication in as short a time as is practical. This allows papers that have been accepted to appear quickly and gives the authors of those papers that have not been accepted an opportunity to exercise other options with a minimum of delay. In practical terms, this means that a decision on the acceptability or otherwise of a paper can normally be expected after no more than two rounds of reviewing. Additional reviewing or initiation of the appeals process should be reserved only for exceptional situations. Extended anonymous review cannot be used as a vehicle to develop an otherwise unacceptable paper into an acceptable one. To arrive at a final decision on a manuscript, the Editors may also

consult an Editorial Board member. (Board members are generally informed of the identities of referees of papers on which they are consulted. See also the section on Author Appeals.)

Authors may submit a list of experts whom they consider especially suited to review their paper. Such a list is particularly welcome when a manuscript treats a highly specialized subject. The Editors are, of course, not constrained to select a referee from that list. If there is a particular individual(s) that authors prefer not be chosen as a referee, they should so indicate and give reasons why. Although such requests are usually honored, it is customary to give authors whose work is criticized in a manuscript an opportunity to respond to the criticism.

Authors may request that their identities not be revealed to the referees (“double-blind” reviewing). If such a request is made, it is the authors’ responsibility to furnish a copy of the manuscript without the authors’ names, addresses, and acknowledgment section.

After acceptance of a manuscript, if further information that seems to warrant investigation is received by the Editors, they will regard it as an obligation to reconsider their decision.

In some circumstances information about a manuscript considered by *Physical Review D* and subsequently submitted to another journal may be provided to the editor of that journal. Such information might include the comments and identities of referees.

### AUTHOR APPEALS

Authors may appeal a rejection of their paper by the Editors. In the case of a formal appeal, the paper and all relevant information, including the identities of the referees, will be sent to a member of the Editorial Board. The Board member may review the case on the existing record or may seek additional expert opinion. The Board member will present a signed advisory opinion to the Editors.

If a Board member has provided a referee report on a paper prior to appeal, another Board member must review the paper on appeal. Authors may suggest those Board members they feel are appropriate (or not appropriate) to conduct the review, but the Editors are not bound by such suggestions. If there is no suitable Board member available, the Editors may appoint an appropriate scientist to consider a paper under appeal as an *ad hoc* Board member.

The author of a paper that has been rejected subsequent to an Editorial Board review may request that the case be reviewed by the Editor-in-Chief of the APS. This request should be addressed to the Editor, who will forward the entire file to

the Editor-in-Chief. Such an appeal must be based on the fairness of the procedures followed, and must not be a request for another scientific review. The question to be answered in this review is: Did the paper receive a fair hearing? The decision of the Editor-in-Chief concludes the consideration of the manuscript by the American Physical Society.

### RECEIPT DATES

Each paper, when published, carries a receipt date indicating when the manuscript was first received by the Editors of *Physical Review D*. If the authors make substantive changes in a manuscript, the paper will also be given a “revised manuscript received” date. If the authors hold a manuscript an unusually long time after it has been returned to them with a referee’s report, the original paper is considered withdrawn and the resubmitted manuscript is considered to be a new paper, with a new receipt date.

Papers transferred from *Physical Review Letters* or other *Physical Review* journals which are accepted without further review (and if the authors have not caused undue delays) will retain the original received date. In other cases a new received date, which is the date of transfer, will generally be given. However, the authors may request that the original received date be retained.

### AUTHOR INQUIRIES

The Author Status Inquiry System (ASIS) provides information to authors regarding the status of their manuscripts automatically via the World Wide Web at the URL <http://publish.aps.org/STATUS/>. Alternatively, authors may send an electronic mail message to [status@aps.org](mailto:status@aps.org) using as the subject line the manuscript code number followed by the last name of the first author (for example, DE1234 Jones). The body of the message should be empty (no human will read it).

Telephone inquiries regarding status are discouraged, since the interruption of normal office procedures can cause delays. In those cases when clarification of the information from ASIS is needed, send an electronic mail message to [prd@aps.org](mailto:prd@aps.org) (with subject line, for example, Status DE1234 Jones).

For papers that have been accepted for publication, information about their status in the production process can be obtained from AIP’s Accepted Manuscript Status Inquiry System (AMSIS) at the URL <http://www.aip.org/msinq/status.html>. You will need the accession code of your paper (called “editor code” on AMSIS) and the last name of one of the first three authors.

## SHORT PAPERS

*Physical Review D* publishes Articles, Rapid Communications, Brief Reports, and Comments. Except for Articles, these are limited in length. Each paper must have an abstract. Announcements of planned research and progress reports are not suitable for publication. A series of short papers by the same authors on a particular subject is discouraged; a comprehensive single regular article is preferred. Authors may follow a Rapid Communication with the subsequent submission of a longer version of the same work, but significant additional material must be included. Neither Articles nor Brief Reports should be followed by such expanded articles.

**Articles** in the *Physical Review* may be short; there is no minimum length limit.

**Rapid Communications** are intended for important new results which deserve accelerated publication, and are therefore given priority in editorial processing and production to minimize the time between receipt and publication. Rapid Communications are similar to *Physical Review Letters*; the principal difference is that Letters are accessible to a general audience of physicists and allied scientists, while Rapid Communications are primarily for a more specialized audience, the usual readers of *Physical Review D*. Rapid Communications in *Physical Review D* are limited to five printed pages.

**Brief Reports** are accounts of completed research which do not warrant regular Articles or the priority handling given to Rapid Communications; however, the same standards of scientific quality apply. (Addenda are included in Brief Reports.) Brief Reports are limited to four printed pages. The normal publication schedule is followed.

**Comments** are publications that criticize or correct specific

papers of other authors previously published in *Physical Review D*. Each Comment should state clearly to which paper it refers and should not contain polemics. Comments are limited to four printed pages. The normal publication schedule is followed.

The reviewing procedure for Comments is usually as follows:

(1) The paper is first sent to the authors whose work is being addressed. These authors may (a) act as identified reviewers and recommend that the paper be accepted, be accepted after revision, or be rejected; (b) submit a reply Comment for simultaneous consideration; or (c) reserve the right to respond following review by an independent referee.

(2) If the issues in question cannot be resolved between the authors of the Comment and the authors of the work being criticized, or if the Editors feel further advice is needed, an independent, anonymous referee will be consulted. If this referee recommends acceptance of the paper, then the authors on whose work the Comment is based are given the opportunity to write a Reply for possible simultaneous publication. This Reply will also be reviewed.

(3) After the Comment and Reply have been accepted for publication, the author of the Comment is sent a copy of the Reply for information, but should not alter the text of the Comment in proof. The Comment and Reply are published in the same issue, the Reply immediately following the Comment.

**Errata** are notices of errors or omissions in papers previously published in *Physical Review D*. Errata should be as brief as possible. An Erratum should contain a short statement of the correction(s) and, where appropriate, a description of any effects on the conclusions of the paper.
